TITLE : BAG-LIKE CONTAINER WITH STRAW

ABSTRACT : PROBLEM TO BE SOLVED: To provide a bag-like container having a straw in which a stored content in the container can be easily drunk by a weak suction force.

SOLUTION: There is provided a self-standing type bag-like container with a straw in which a pouring-out member 2 having a straw 24 is sealingly fixed to a bag-like container main body 1. The pouring-out member 2 is formed with a straw 24' extending up to a bottom part of the bag-like container main body 1. The pouring-out member 2 is formed with a suction hole to cause one end side to be sealed by an easy-seal opening type seal 27 and the other end side to be opened into the bag-like container. The suction hole is provided with a check valve for sealing the suction hole by an increased pressure in the bag-like container main body. The sealing part for the suction hole is removed from the bag-like container to suck up the stored content through the straw, resulting in that the surrounding atmosphere flows into the bag-like container main body through the check valve so as to fill a space for the stored liquid corresponding to the sucked-up amount.
